Office Action Summary

Application No.

10/773,465

Applicant(s)

MORIWAKI ET AL.

Examiner

Patrick Butler

Art Unit

1732

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 21 September 2006.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-17 is/are pending in the application.
- 4a) Of the above claim(s) 10-17 is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-9 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 09 February 2004 is/are: a) ☒ accepted or b) ☐ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Response to Amendment

The Applicant's Amendments and Accompanying Remarks, filed 08 September 2006, have been entered and have been carefully considered. No Claims are new, amended, or canceled, Claims 1-17 are pending, with Claims 10-17 being withdrawn.

In view of Applicant's filing of translations of priority documents on 21 September 2006, the Examiner withdraws the previously set forth 35 U.S.C. 103 rejection as detailed in the Claim Rejections - 35 USC § 103 section of the Office Action dated 08 June 2006.

Despite these advances, the invention as currently claimed is not found to be patentable for reasons herein below.

Specification

The title of the invention is not descriptive. A new title is required that is clearly indicative of the invention to which the claims are directed.

The following title is suggested: Resin material remolding method.

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-9 are rejected under 35 U.S.C. 103(a) as being unpatentable over Nishibori et al (5323971) in view of Gordon et al. (UK Patent Application GB 2 121 535 A).

Regarding claim 1, Nishibori et al teach a resin material remolding (abstract) method comprising: a preparation step of preparing pulverized pieces obtained upon pulverization of a coated resin molded product (col. 7 lines 30-52) and coating film peeling of pulverized pieces (col. 7 lines 53-59); and a molding step of performing molding by using the pulverized pieces having no coating film adhered after the separation step (col. 23 lines 24-21). Nishibori et al also recognize the strong adhesion strength of the coating film on the resin article and the difficulty of peeling off the film (col. 2 lines 57-64 & col. 23 lines 14-21) but do not teach a determination step of sensing and determining the presence/absence of adhesion of the coating film for each individual pulverized piece after the preparation step; a separation step of separating a pulverized piece having the coating film adhered from pulverized pieces having no coating film adhered, on the basis of the determination result.

Gordon teaches a sorting system wherein desired objects are detected amongst a plurality of objects and separated therefrom (a separation step of separating a pulverized piece having the coating film adhered from pulverized pieces having no coating film adhered) (see page 1, lines 5-11). The sorting system utilizes a detector suitable for detecting the presence of an object with desired characteristics (a determination step of sensing and determining the presence/absence of adhesion of the

coating film for each individual pulverized piece after the preparation step) (see page 1, lines 5-11).

It would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Gordon's detection and sorting system in the method of remolding taught by Nishibori in order to focus the practicing of the method of separating the skin and resin taught by Nishibori by detecting the object with the skin and resin/desired characteristics (see Gordon, abstract). Moreover, one would be led to separate out particles with the coating film still on it and process those free of any coating film. Nishibori et al teach that the coating film is usually resin material of different colors (col. 2 line 42-46). Thus, one having ordinary skill in the art would be led to use Gordon's sorting step based on color to separate out pulverized powder with coating film from those free of coating.

Regarding claims 2 and 3, Nishibori et al do not teach that the determination step senses and determines the presence/absence of adhesion of the coating film by sensing the coating film itself or a specific material present in the coating film by using a sensor for sensing the coating film on the basis of a difference in lightness. However, Gordon teaches detecting a characteristic of an object (presence of adhesion of the coating film by sensing the coating film itself or a specific material present in the coating film by using a sensor) (page 2, lines 14-20). Therefore, it would have been obvious to one having ordinary skill in the art at the time of invention to modify Nishibori et al's method for resin material remolding to include detecting a characteristic of the material in order to properly sort the object (see Gordon, page 2, lines 56-58). The frequency of

Art Unit: 1732

irradiation and response is in the optical region (color) (see Gordon, page 2, lines 36-44).

Regarding claims 4, Nishibori et al do not teach the sensing is executed by sensing means for irradiating the pulverized pieces with X-rays, and sensing X-rays having a specific wavelength excited from a specific material present in the coating film. However Gordon teaches exciting the material with X-ray for detecting a characteristic of the object (see page 2, lines 14-20 and lines 36-44).

Regarding claim 5, Nishibori et al do not teach that the sensing is executed for the pulverized pieces in a plurality of directions. However, Gordon teaches that the detection is from a variety of directions (see variety of angles in Fig. 1).

Regarding claim 6 and 7, Nishibori et al do not teach that the determination step executes the sensing in a specific position midway along a moving path in which the pulverized pieces are moved in a specific direction, and the separation step executes the separation, when a pulverized piece having the coating film adhered is sensed in the determination step, by blowing a gas against the pulverized piece during freefall to change a moving direction of the pulverized piece having the coating film adhered to a direction different from a moving direction of a pulverized piece having no coating film adhered.

However, Gordon teaches that the sensing is done in specific positions between the beginning and end of the path (see Figure 1) and the separation is executed by a nozzle array (blowing a gas) in free space (free fall) (see page 3, lines 3-7 and 30-40).

Regarding claim 8, Nishibori et al teach that the coated resin molded product is pulverized at random by using a cutting tool having a rotary/stirring blade (col. 12 lines 39-53). Nishibori et al also teach classifying the pulverized pieces by particle-diameter (fig 13, **255**) but do not teach the determination step. However, Gordon teaches this determination step (page 2, lines 14-20). Therefore it would have been obvious to one having ordinary skill in the art at the time of invention to modify Nishibori et al's method for resin material remolding to include a determination step after step **256** in order to separate out unwanted components.

Regarding claim 9, Nishibori et al teach that the coated resin molded product is a used automobile part (col. 2 lines 29-41).

Response to Arguments

Applicant's arguments filed 08 September 2006 have been fully considered but they are not persuasive.

Applicant argues with respect to the 35 USC 103 rejections. Applicant's arguments appear to be on the grounds that:

1) Zeiger is not applicable given the foreign priority dates, which antedate the publication date of Zeiger.

The Applicant's arguments are addressed as follows:

1) In view of Applicant's filing of translations of priority documents on 21 September 2006, the Examiner withdraws the previously set forth 35 U.S.C. 103 rejection as detailed in the Claim Rejections - 35 USC § 103 section of the Office Action dated 08 June 2006.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Patrick Butler whose telephone number is (571) 272-8517. The examiner can normally be reached on Mo.-Th. 7:30 a.m. - 5 p.m. and alternating Fridays.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Christina Johnson can be reached on (571) 272-1176. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.
